

ABDOMINAL AORTA & INFERIOR VENA CAVA

NAME THE VENTRAL UNPAIRED BRANCHES OF ABDOMINAL AORTA(SA)

LIST THE VENTRAL BRANCHES OF ABDOMINAL AORTA(SA)

Coeliac trunk- It is the artery of foregut, arises at the level of T12

Superior mesenteric artery- It is the artery of midgut, arises at the level of L1

Inferior mesenteric artery- It is the artery of hindgut, arises at the level of L3

Name the lateral branches of abdominal aorta

These are Paired arteries.

From above downwards,

Inferior Phrenic arteries

Middle suprarenal arteries

Renal arteries

Gonadal arteries (Testicular artery or Ovarian artery)

ABDOMINAL AORTA- LABELLED DIAGRAM, BRANCHES(SE)

Branches of abdominal aorta

Ventral Branches

Lateral branches

Dorsal branches

Terminal Branches

Ventral Branches: These are unpaired arteries

Coeliac trunk

Superior mesenteric artery

Inferior mesenteric artery

Lateral Branches:

These are Paired arteries.

Inferior Phrenic arteries

Middle suprarenal arteries

Renal arteries

Gonadal arteries

Dorsal Branches:

Four pairs of lumbar arteries

Median sacral artery

Terminal Branches:

Right and left common iliac arteries

INFERIOR VENA CAVA(SE)

Vein which drains the venous blood from the body below the diaphragm

Formation:

Formed at the level of L5 vertebra

Formed by the union of right and left common iliac veins

Course:

From the level of its origin it courses upwards

It ascends upwards along the posterior abdominal wall lying just to the right of abdominal aorta

Then it ascends along the posterior aspect of Liver, lying the groove for IVC

Passes through the vena caval opening of the diaphragm at the level of T8 to enter thorax

Terminates by draining into right atrium

Tributaries

- Pair of common iliac veins
- Lumbar veins
- Pair of renal veins
- Pair of phrenic veins
- Right gonadal vein
- Right suprarenal vein
- Hepatic veins

Applied Anatomy:

If there is obstruction of inferior vena cava, collateral circulation may be established between the tributaries of superior vena cava.
